

## Are Dental Implants Permanent? The Real Truth

When you lose a permanent tooth, the search for a replacement usually leads to one definitive answer: dental implants. But as you scroll through various options for [dental implants in Gurgaon](#), one question likely sticks in your mind: Are they actually permanent?

In the world of dentistry, the word "permanent" is often used, but it's important to understand what that means for your mouth. At The Dental Roots, we believe in providing our patients with the "real truth" so you can make an informed decision about your smile.

### Are ***Dental Implants*** Permanent? The Real Truth

Here is everything you need to know about the longevity, success, and reality of dental implants.

### What Makes a Dental Implant "Permanent"?

Unlike dentures that sit on the gums or bridges that rely on adjacent teeth, a dental implant is designed to become a part of your body. It consists of three main components:

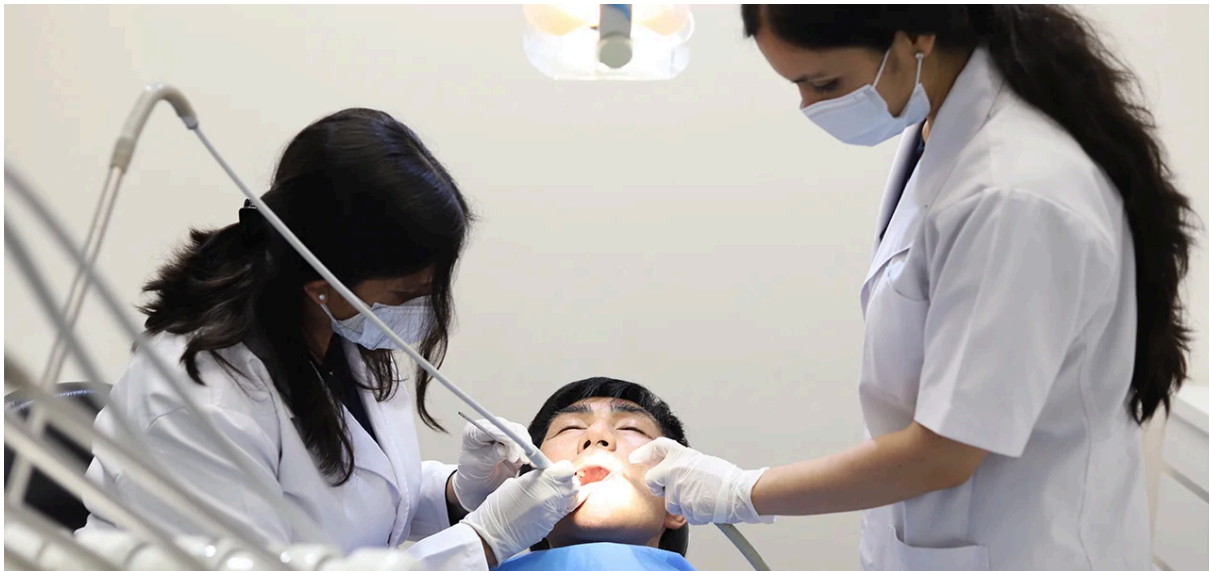

1. The Implant Post: A small titanium screw that acts as an artificial tooth root.
2. The Abutment: A connector that holds the new tooth in place.
3. The Crown: The visible part that looks and functions like a natural tooth.

The "permanence" refers primarily to the titanium post. Through a biological process called osseointegration, your jawbone actually grows around the titanium, fusing with it. Once this bond is formed, the implant is as stable as a natural root.

## The Real Truth: How Long Do They Actually Last?

If you are looking for the [best dental implants in Gurgaon](#), you are likely looking for a lifetime solution. The truth is that while the implant post can last 25 years to a lifetime, the crown (the part you chew with) typically needs replacement every 10 to 15 years due to normal wear and tear—much like a natural tooth can chip or wear down over time.

Research shows that dental implants have a staggering success rate of 95% to 98%. However, their "permanence" depends on a few critical factors:

### 1. Bone Health and Density

For an implant to be successful, it needs a solid foundation. If you have been missing a tooth for a long time, the jawbone may have shrunk. In such cases, our specialists at The Dental Roots might recommend a bone graft to ensure the implant has enough support to stay permanent.
